Editor: GILBERT H. GROSVENOR

Associate Editors

GENERAL A. W. GREELY
Chief Signal Officer, U. S. Army

W. J. McGEE
Chief, Department of Anthropology and Ethnology, Louisiana Purchase Exposition

C. HART MERRIAM
Chief of the Biological Survey, U. S. Department of Agriculture

WILLIS L. MOORE
Chief of the Weather Bureau, U. S. Department of Agriculture

DAVID G. FAIRCHILD
Agricultural Explorer of the Department of Agriculture

O. H. TITTLMANN
Superintendent of the U. S. Coast and Geodetic Survey

O. P. AUSTIN
Chief of the Bureau of Statistics, Department of Commerce and Labor

DAVID T. DAY
Chief of the Division of Mineral Resources, U. S. Geological Survey

IDA M. TARBELL
Author of "Life of Napoleon," "Life of Lincoln," etc.

CARL LOUISE GARRISON
Principal of Morgan School, Washington, D. C.

WASHINGTON, D. C.
At the very outset I shall throw myself on your kind indulgence. I hope you will not think me one of that rash company, more numerous in enrollment than polite in name, that rush in where angels fear to tread. Believe me, I know full well the difficulty and the delicacy of my venture, and have known it from the start. The only excuse that can be pleaded in extenuation of the hazard is that the persuasiveness of your committee, if not greater than the restraint of my warning good sense, was at least more potent than the firmness of my resolution.

Russia just now is at the best a tempting but perilous theme. Half a century hence it will be possible to look back through the clear perspective of years and measure the true relations of the events of today to a new career of progress and greatness. But in the present hour we see the portents without the promise, and Russia is shadowed by the gloom of the clouds without the gleam of the sun. The inherent difficulties of the subject are enhanced by the personal position of the speaker. There are phases on which it is becoming that I should speak with reserve—perhaps, to use an Hibernianism, with silence—on the principle, "the wisest word I ever said was the word that wasn't spoken." It is true that the diplomatic trust was laid down some years ago, and the easier, if not higher, diplomacy of American free speech was resumed; and you will permit me to amend the words of the poet and say:

More true joy returned Marcellus feels
Than exiled Minister with a Senate at his heels.

But there are obvious proprieties which follow the minister even in retirement; yet while they should be respected, there is still large room for free expression. I did not hesitate to say in St Petersburg, looking out from the Foreign Office upon the broad Alexander Place, from the center of which rises the stately and splendid memorial shaft to the first Alexander, that there were things in Russia which we of the United States, in the best spirit of sincere friendship, could wish otherwise.

*An address to the National Geographic Society, January 26, 1905.*
and I do not hesitate to say it here. Russia does not resent honest criticism. She criticises herself. Her statesmen are sensible of her relations to the spirit of the age and are conscious of her difficulties and shortcomings. She only asks—and does she not rightly ask?—that judgment shall be pronounced in good faith, and with an honest purpose to be fair. She is often silent when in justice to herself she ought to speak. To my mind it is a mistaken policy, for while it avoids answer where answer would sometimes be difficult, it leaves a hundred misrepresentations to pass unchallenged; but, mistaken or not, it is the tradition of a power which meets political hostility or thirsty sensationalism with disdain.

And certainly, if there be a grateful sense of invaluable service, we of America ought at least to seek to be fair. We never can be deaf to the call of humanity. We cannot be blind to the errors which have followed unfortunate counsels. We must deal with living issues and with present events as truth requires; but we can and we ought to fulfill the obligations of duty and speak the voice of judgment in the spirit of honest and manly friendship. For Russia was our truest friend in the hour of our supreme trial. Tradition has handed down this impressive truth, and both the public archives and the unwritten records confirm it. You know that in the critical period of the civil war, when we were threatened with French and English intervention, the Russian fleet appeared in the harbor of New York. The testimony is not wanting which discloses the inspiration and the purposes that placed it within that friendly and protecting proximity. There has been some dispute over this question, and the attempt has been made to discredit the sympathetic attitude and the actual service of Russia, but the evidence is clear and conclusive.

Shortly after the war began in 1861, the Secretary of State, Mr Seward, addressed the European governments, setting forth the American position. Prince Gortchakoff, the great Russian chancellour, wrote these words in reply:

"The Union is not simply in our eyes an element essential to the universal political equilibrium. It constitutes besides a nation to which our august master and all Russia have pledged the most friendly interest, for the two countries, placed at the extremities of the two worlds, both in the ascending period of their development, appear called to a natural community of interest and of sympathies, of which they have already given mutual proofs to each other."

That unequivocal answer, made at the very beginning, plainly indicated the friendly attitude of Russia. Through the Russian government, with its special sources of information, President Lincoln's administration was kept advised of what the other governments of Europe were meditating and proposing. Official France was hostile. The French people were sympathetic, as they had been from the days of the American Revolution. But Louis Napoleon, who was then on the throne, had his own designs, which were disclosed in Mexico. Official England, unlike the official England of these later years, was also hostile. A large proportion of the English people, many of whom in Lancashire deeply suffered on account of our war and the deprivation of cotton, were right in their instincts. The great and good Queen was our steadfast friend. But Palmerston and Lord Russell, and even Mr Gladstone, whom we have all so greatly admired and honored, looked on our struggle with unkindly thought.

In the early days of the war Secretary Seward was apprised, through the legation at St Petersburg, that the French and English governments had come to an understanding for joint action re-
specting the American war involving the possible recognition of the Southern Confederacy. When, soon afterwards, the French and English ministers appeared at the State Department together his information prepared him to meet them. Knowing their object, Mr Seward politely avoided receiving them jointly and adroitly turned one off with a dinner invitation while he saw the other alone. But the joint movement of the two governments went on. Joint action on neutrality pointed the way to joint action on intervention. Who could measure the dangers of such a portentous step? Would Mr Lincoln's government, already absorbed in a life-and-death grapple with a giant rebellion, also accept the gage of war with the united strength of the two great nations of western Europe? Could it hope to prevail against these combined perils, or would the unequal struggle leave the Union irretrievably divided and broken?

That was the startling menace. Russia's feeling was known, and before the blow was struck it was important to know what Russia would do. Louis Napoleon took steps to ascertain—I have reason to believe through an autograph letter to the Czar, Alexander II, advising him that the French and English governments believed the time had come when they ought to mediate or intervene between the North and South, and inviting him to join in the movement. The Czar declined to do so unless Mr Lincoln's government should request it. But the menace continued, and therewith the Russian fleet steamed into the bay of New York and cast anchor within sight of Trinity spire. All the world knew what that act meant; Louis Napoleon knew, and the threatened intervention never came.

This chapter of past judgments does not justify any misjudgments now, but it does impose the obligation of seeking to pronounce present judgments in a fair and just spirit. Russia is engaged at this hour in a foreign war which has thus far been full of surprises and disasters, and she is at the same time in the throes of a domestic agitation which, let us hope, will lead to a great advance for the Empire. No treatment of the general subject can ignore these phases, and they will be the better understood if we look at them against the background of the national structure and organization and character.

Russia is a country of extraordinary contrasts; of imperial splendor and of widespread poverty; of the magnificence of the court and of the squalor of the monik; of the stately grandeur of St Petersburg or the picturesque orientalism of Moscow, and of the dreary, dead level of dull and endless plains; of the highest culture and the broadest ignorance; of the boundless treasures of the unequalled Winter Palace, with its 500 opulent rooms, or of imposing St Isaac's, with its malachite columns and its golden dome, and of the boundless destitution of almost uncounted millions; of the literary genius of Pushkin and Gogol, of Tourgenieff and Tolstoi, and of the dense illiteracy of the masses; of the pictorial wonders of Verestchagin and of the most primitive agricultural and industrial arts—in a word, of the highest development of grace and culture in social life and of the deepest penury and hardship on the broad national field.

And as it is a country of extremes in condition so it has been portrayed in extremes of opinion. On the one hand it has been painted in the blackest of colors. It has been pictured as a land of Tartar barbarism and of Muscovite tyranny, where the Siberian exile is the expression of all cruelty and the Jewish proscription as the embodiment of all intolerance and persecution. Its government has been described as a despotism tempered by assassination. On the other hand it has been delineated in some quarters as a benign and patri-
archal system, where the sole thought of the Little Father is the welfare of the millions of his people, and where the acknowledged grace of the throne is accepted as the proof of the general practice. It is easy to produce striking effects with strong pigments. There would be a ready and startling sensationalism in a vivid picture of terrors and in a flaming outburst of rhetoric. But, as generally happens, the truth lies between the extremes. It is not all black or all white, but it has its lights and its shadows, and the faithful delineator must sacrifice the bold outlines of a fanciful sketch for the more subdued tones of historic verity.

The character of autocratic rule manifestly depends very much on the character of the autocrat. It is true that in these modern days even the autocrat is largely the creature of conditions. Imperial will is molded and circumscribed by historic tendencies, by overmastering public opinion, and by the spirit of the age. But, on the other hand, the currents of national development fall into the eddies of personal impulse. With the vast machinery of a great modern autocracy becomes bureaucracy. But the autocrat makes the bureaucrats, and so determines the trend. There are settled traditions and tendencies in Russia, but they are affected and modified by the dominant temper and influence of the hour. When Russia passed from the scepter of Nicholas I to that of Alexander II she advanced from the virile and robust imperialism of an iron dictator to the progressive and expanding liberalism of an enlightened ruler. When she passed from the control of Alexander III to that of Nicholas II she went from the secure, harsh, rigorous sway of a firm, self-poised, austere monarch to the turbulent reign of a kind, well-meaning, and uncertain sovereign.

The present Czar is conscientious and devoted in public purpose and amiable and exemplary in personal life. He has been surrounded by conflicting influences, and each of the opposing forces has appeared at one time or another to be dominant. The Czar's disposition and tendency have been liberal, as was indicated in the noble impulse which convoked the Hague Conference. If at times there has been a backward movement it was because reactionary elements outside of the throne gained a temporary ascendancy, and if lamentable errors plunged the empire into a war for which she was so ill-prepared, it was because irregular influences, outside of the ministry, that were mistakenly trusted, gave evil counsels.

As a rule, Russian ministers are not personal favorites, but are often able statesmen, marked for their places by capacity and fitness. Their commission comes, not from title of nobility, but from the higher title of brains. Curiously as it may cross the prevailing conception of the Russian system, many of them have sprung directly from the ranks of the people. M. de Giers, the astute Minister of Foreign Affairs, who succeeded Gorchakov and who so long guided the foreign policy of his country, did not inherit rank or fortune. Equally without rank was Vishnegradski, the Minister of Finance, a remarkably able man, whose range of vision covered the finance of all nations, who carried on his table the first free-silver bill just as it was lying on the desks of the American Senate, and whose acute and profound observations, if they could have been properly reported, would have instructed and startled the American people.

His successor, de Witte, who was so long the master spirit of the Russian government, who then fell into disfavor, and who in the present crisis appears to be again rising into favor and ascendancy, is no less a man of the people. He made his first mark as a subordinate railway official, and was rapidly promoted until he became the most power-
ful minister of the empire. Many others might be named to illustrate the same truth of high individual advancement without title or favor and solely on merit. Russia has ministers, but no ministry. There is no united, coherent, responsible governing body. Each minister acts only for himself and is responsible only to the Emperor. Oftentimes ministers antagonize and intrigue against each other. Witte and Plehve were at swords' points. Thus the bureaucracy lacks unity, cooperation, and efficiency. It is disorganized and discordant. Sometimes an individual minister shows tremendous energy in the administration of his department, but the coordinated work which gives united force and strength is missing.

Below the chiefs the system has the vice of venality. It is this which has sapped the strength of the navy and impaired the efficiency of the army. It is this which has provided the gun of inferior range and imparted structural weakness to the battleship. Russia has prodigious resources and almost unlimited power, if it can be made available. She has the giant's strength, but the giant's strength enfeebled by a vicious system and an improvident sloth. There is personal valor and symptomatic defect. There is the brilliant dash of the daring Makaroff, but a strange paralysis and fatality of the fleet. There is the skillful generalship of Kuropatkin, with the patience of Fabius and the fight of Marius, but a want of preparation which leaves him always with inferior numbers. There is the intrepid courage of the heroic Stoessel and his fire-tried troops at Port Arthur, which has excited the admiration of the world, but there is at the same time the lack of equipment which crippled his defense. The fighting quality and the latent power are there, but reconstruction is needed to bring the fruits.

In some directions Russia has made remarkable advances in recent years. The energetic and far-reaching policy of Witte as Finance Minister, with its striking results, has been the subject of great praise and great criticism. It had two central and fundamental conceptions. The first was to make Russia wholly self-sustaining and industrially great by a system which should protect and foster her own manufactures. The second was to concentrate all power and control in the hands of the government by substituting state for local taxation, by the promotion of state ownership of railroads, and by the creation of great state monopolies, like those in spirits, drugs, and kindred articles. The fruits have been tremendous, though possibly in some directions open to question.

The industrial progress of Russia in the face of serious obstacles has been signal. Within ten years the number of hands employed increased from 1,318,048 to 2,098,262 and the value of the output more than doubled. The chief industries are textiles and mines and metals. Cotton manufactures have been rapidly developed. The consumption of cotton has increased in little more than a decade from 1,17,000,000 kilograms to 2,57,000,000, and the number of spindles in operation is about 7,000,000. In iron manufacture Russia holds the fourth place among the nations, ranking next to Germany and ahead of France. From 1892 to 1900 the annual production of metallic articles rose in value from 1,42,000,000 roubles to 276,000,000.

The advance was so rapid that after 1900 there was a reaction, followed by an industrial crisis. In his report on the budget for 1902, M. Witte ascribed the depression to a succession of bad harvests and a withdrawal of foreign capital, caused by the Boer war and the resulting stringency in the European money markets. Doubtless also the extraordinary development had engendered speculation and overproduction.
The great growth had come in spite of deficient transportation, of ignorant and debilitated labor, and of the meager purchasing power of the mass of the people. Russia has made much headway in recent years in remedying the first defect. From 1892 to 1902 more than 17,000 miles of railroad were opened. Within the Russian Empire, not including Manchuria, 4,100 miles of railway were under construction in 1901. With his early training, M. Witte naturally made railroad development a vital part of his great and vigorous policy of national upbuilding—a policy which was largely instrumental in this industrial and commercial expansion. In ten years the passenger traffic on the Russian railroads has multiplied almost five-fold and the freight traffic more than eight-fold.

But there is a deeper and more radical difficulty. It is suggested in the observations of Prince Mestchersky, the bold and brilliant editor of the Grassdauin, of St Petersburg. Writing in 1901, he said: "It would be more logical for the development of mills and works to begin with the development of the people, so as to create a consumer, than to begin with the development of factories, mills, and railroads for a people wanting in the very first elements of prosperity." His conception is that the hope of Russia lies in an improved condition and advancement of the peasantry. The weakness of the Russian system is in the backwardness of agriculture. The agriculturists constitute 78 per cent of the population, and for the most part are surrounded by the most unfortunate conditions. Their implements are of the most primitive character. The crop yield per cultivated dessiatin is lower than in any other country in Europe. Be gium, which ranks first, produces an average of 128.5 pounds of grain per des siatin, a pound being equal to 36

only 38.8 pounds. Even this disparity does not indicate the full gravity of the case, for Russia produces less grain per head than is consumed per head in other countries, and at the same time she is the second grain-exporting country in the world.

This fact tells the story of her own deprivation, and it is emphasized by some particular inquiries. It is estimated that the people on the farms require from 20 to 25 pounds of grain per head for their support and that of their live stock during the year, and these figures are much below the consumption in other lands. Yet it often happens that in a considerable number of provinces the harvest is far less than even this meager requirement. The result is that Russia is frequently afflicted with famines, that the consumption of bread has fallen off about 70 per cent, and that the number rejected from the military service through physical disqualification has increased 14 per cent within seven years. During the great famine of 1891, which extended over ten provinces, more than a million horses perished, leaving many of the peasants with no means of cultivating the land. The crop failure of 1898 did not cover so wide an area, but it was even worse where it prevailed. It left over 12,000,000 people in abject destitution and more than 8,000,000 suffering from actual famine. In 1900 and 1901 famine again desolated the land. All this entails chronic impoverishment. The arrears in the redemption of the land on the part of the former serfs are constantly increasing, and the economic conditions which affect them are growing worse.

The amelioration of this situation lies at the foundation of the present agitation for political reform and enlarged freedom. Undoubtedly, the popular restiveness has been quickened by the war and its demonstration of the defects of the existing system; but the recent
striking manifestations are only the sudden culmination of a movement which has been in progress for some time. To understand it we must grasp some fundamental elements of the Russian polity. Russia presents a curious paradox. Theoretically it combines the most extreme autocracy with the most extreme democracy. The great body of the people are divided and organized into "mirs," or communes. The mir is what we would call the township organization. Land is held in common and is apportioned for cultivation among the families of the mir according to their respective needs. The communal assembly makes the apportionment and the periodical redistributions; it governs other questions relating to the land, the harvest and other local affairs, and its government is more like that of the New England town-meeting than anything else. As far as it goes, it is a perfect democracy. All the people assemble on the village green, under the presidency of the starosta, or village elder, and determine all questions within their scope by a majority vote.

The mirs are grouped into cantons or districts, and the districts elect representatives to the zemstvos, which are the provincial assemblies. Without going into minute details, all classes are represented. The ultimate elective bodies are not large in proportion to the total population, but they are distributed among peasants, individual landholders, merchants, nobles, and urban electors. In 361 district assemblies, with 13,196 members, 38 per cent were peasants, 35 per cent nobles, 15 per cent merchants, and the remainder officials or priests. The provincial assemblies or zemstvos have over 1,200 members in all, and they operate chiefly through executive committees, of which the nobles constitute far the larger proportion. The mir deals with the land, farming, and the immediate local concerns. The district assembly, which corresponds more nearly with our county organization, looks after roads, schools, sanitary matters, and like questions. The provincial assemblies have the care of prisons, hospitals, charities, main roads, mutual insurance, and other subjects of more than local range.

The zemstvos were among the reforms instituted by the liberal and enlightened Emperor, Alexander II. They were created in 1864, and sprang from a commission appointed for the purpose of "conferring more unity and independence on the local economic administration." Theoretically they went far toward establishing a system of local autonomy, but practically they have been largely nullified by the overruling power of the provincial governors, who stand for the bureaucracy. Their authority and independence have from time to time been curtailed. Nevertheless, in their form as local representative assemblies, even with their limited electorate and scope, they furnish the basis and nucleus for wider representative institutions. Their liberal spirit and independent purpose have been the most characteristic features in the new reform movement.

In January, 1902, the present Emperor created a Central Committee of Agriculture, under the presidency of M. Witte, to consider the measures necessary to meet the existing difficulties. This body was supplemented by local advisory committees, which, rather by local choice than by central design, were made up largely from the zemstvos. The majority of these committees made some significant recommendations. They urged that elementary education should be increased; that zemstvos should be established in provinces where they did not exist, and made more representative, with larger powers; that the system of village communes should be reconstructed so as to give the peasants equality with others, and that free discussion of economic questions should be allowed.
A little later a memorandum was presented to the Czar recommending that their old powers should be restored to the zemstvos, that they should be arranged in groups, and that these groups should elect delegates to a central or national zemstvo.

The effect of these various demonstrations was seen when in February, 1903, the Czar issued a manifesto holding out high promise. He declared that the fundamental principle of property in common must be held inviolable, but he said that relief for the individual must be found, and added: "A reform is to be effected by local representatives in provincial government and district administration." These assurances were neutralized when the influence of Witte waned and the reactionary Plehve gained more power; but they and the manifestations which led to them were the forerunners of the more impressive demonstrations that have recently been witnessed. The meeting of the zemstvo presidents at St. Petersburg in November last was in many respects the most remarkable assemblage in Russian history. It was almost like a states general. It put forth a declaration of principles which is equivalent to a demand for a national representative assembly with political voice and rights and with a direct advisory part in legislation and government. It plainly declared that there is an estrangement between the government and the people; that it is due to fear of popular initiative, and that it has led to great wrongs in the arbitrary bureaucratic system which has come between the throne and its subjects. It calls for the overthrow of this centralized administration of local affairs; for independent legal tribunals for the protection of personal rights; for free speech, free press, and free conscience; for equal civil and political rights for peasants; for the greater independence and extension of the zemstvo institutions, and for national representation through an elective body which shall participate in legislation.

These demands are unprecedented in Russia, and their concession would inaugurate a revolutionary change. It was not to be expected that they would all be granted at once. The ukase which the Czar has issued in response to this call marks a large advance. It charges the Council of Ministers with the duty of framing measures to secure equal rights to the peasants; to safeguard law and unify judicial procedure for the protection of personal rights; to assure a more independent and complete administration of local affairs through local institutions; to deal with state insurance for workmen; to reduce the discretionary authority which has bred the administrative process; to promote larger religious toleration, and to provide greater freedom of the press. This is a long step in liberalism. It does not establish representative institutions; it does not provide for elementary education; but it does look toward a larger local control of local affairs, toward the relief of the peasants from the rigorous conditions which surround them, and toward the removal of the arbitrary restrictions which now burden the people; and the ukase itself distinctly treats these reforms as the beginning of "a series of great internal changes impending in the early future."

In considering the character, trend, and methods of these changes the peculiar conditions of Russia must ever be remembered. Whatever advance has been made there up to this time has come from the top and not from the bottom. The great mass of the people are simple, illiterate, and inert. The disturbances which have occurred from time to time have been mostly on the surface. The great deeps have not been moved, though the caldron is now seething as never before. The new industrial conditions of recent years, to which reference has been made, have produced a class of
workmen and artisans in the cities who are more alert than the supine peasantry and who are the source of the present discontent and uprising.

The whole fabric of society, it must also be borne in mind, rests upon the church which is the very foundation of the state and to which in its ritual and observances all, from the Czar to the humblest monjik, are supremely devoted. The first need of the people is economic improvement and their release from the harsh conditions of their restricted communal life. The report of Witte on the elevation of the peasant contemplates some reconstruction of the mir and the opening of broader callings and opportunities to those who are practically bound to the soil. It is urged with force that real social emancipation cannot come without political enfranchisement. The one will undoubtedly promote the other, and under the quicker impulse of these later days the nation is moving forward to both.

Russia is passing through the dark valley of deep trials. She is paying the appalling cost of grievous mistakes; but enormous as that cost is, it will still be cheap if, through these bitter experiences and this new awakening, the great empire shall be put upon the higher pathway of wiser counsels and liberal advancement. The history of Russia is a varied story. It is illuminated with the progressive measures of the great Emancipator. It is darkened with the shadows of Kishinev and the Finnish oppression. The far-reaching reforms which are now dawning on the nation give promise of a new and more hopeful era. Russia has prodigious recuperative power. She was prostrate after the Crimean war, but soon recovered her strength. She was humiliated and straitened after the Turkish war, but started again upon a new career. She is patient, tenacious, and persistent; she has the traditions and the indomitable faith which have come down from Peter the Great; she has the vast though dormant resources of imperial domain and power; and if through the disasters she is now suffering she shall throw off the shackles of the bureaucracy that have weighed her down and come to share the progressive spirit of the age, she will through present tribulations and final regeneration enter, as we hope she may, on a new and brighter epoch.

MARINE HYDROGRAPHIC SURVEYS OF THE COASTS OF THE WORLD*

BY GEORGE W. LITTLEHALES

THE accumulated stock of marine hydrographic knowledge in its availability for the construction of navigational charts of the coasts of the world is divided into four classes for the purposes of this communication. Upon the accompanying world chart the extent of coast line comprised within each of these four classes is indicated by appropriate symbols depicting the coasts that are completely surveyed, those that are incompletely but serviceably surveyed for purposes of navigation, those that are explored for purposes of navigation, and those that are unexplored for purposes of navigation.

It should be made clear with reference to those coasts which are classed as being completely surveyed that, excepting in rare instances, no greater completeness

*An address to the Eighth International Geographic Congress, September, 1904.
has been attained in the portrayal of the forms and characteristics of the strip of the sea bottom which borders the coast than is yielded by measurements obtained by dropping a sounding-plummet at close intervals, and that nearly all coasts and harbors, whatever may be the initial completeness of the surveys, require reexamination in the course of time to disclose the altered conditions that are produced by natural agencies and artificial developments.

It will not escape attention that while there is a comparatively small total extent of completely surveyed coast which bounds the world's seats of enlightenment and wealth in the Northern Hemisphere, the extent of coast that is unex-
plored for purposes of navigation is yet smaller and is almost confined to the frozen regions of the earth, which are unvisited by commerce and unpeopled. A prominent feature of the investigation and one which can not fail to bring a realization of the great responsibility resting upon navigators and the skill and caution required of them in the navigation of coastal waters in nearly all parts of the world is the immense extent of the coast line which, while sufficiently known to be approached, can not be navigated with security.

It is in general useless for the nautical surveyor of the present day to devote himself to the rapid reconnaissance of a coast in the manner that proved so ac-
ceptable in the middle of the last cen-
tury, for such a survey would not
now prove beneficial with reference to
any but the unexplored regions.

The parts of the world that have been
completely surveyed and the parts about
which, from the standpoint of the ma-
rine hydrographer, nothing is known
are equally beyond our concern at pres-
ent, for on the one hand the needs of
commerce and navigation have been met
and on the other hand commerce and
navigation have as yet no needs. It is
to the vast extent of the coasts of the
world concerning which marine hydro-
graphic knowledge exists in varying de-
grees of incompleteness that we should
address ourselves with a view of direct-
ing attention to the faults which may
be corrected and to the wants which
may be supplied.

Leaving our own completely sur-
veyed Atlantic seaboard, we come at
once among the oldest colonies in the
Western Hemisphere and in a sea of
great present and prospective impor-
tance, upon coasts concerning which
there is no adequate information for the
construction of charts and the guidance
of shipping. The coasts of the Island
of Haiti, outside of the more important
ports and harbors, are very imperfectly
charted. Our knowledge of the har-
bors of Cuba has been lately much im-
proved, but the sections of coast con-
necting these harbors is not yet well
represented. No better portrayal of the
north coast of South America from
Panama to Trinidad has ever been af-
forded than that which resulted from a
cursory examination made in the early
part of the last century. There are
doubtless many places along this coast
where future surveying operations will
develop useful anchorages for the im-
provement of commerce and the safety
of vessels. The ports leading to many
of the important maritime centers of
Brazil have been efficiently surveyed,
but the general approaches to the coast
are not completely developed. In the
Rio de la Plata navigation has been ren-
dered fairly safe, but of the intervening
coast, until the Strait of Magellan is
reached, it may only be said that, be-
yond several isolated local surveys lately
executed by the Argentine government,
nothing has been done since the general
examination in 1830. The efforts of
British and Chilean hydrographic sur-
evors have effected much improvement
during the last generation in the charts
of the Strait of Magellan and through-
out the waters of Chile, although the
whole labyrinth of channels in southern
Chile is still inadequately known for the
purposes of the many steamers that are
continually passing through; and with
reference to the entire western coast of
South America, the efficient surveying
operations have clustered around local
developments that were taking place
here and there, leaving no general sur-
voy of the whole coast by which it can
be laid down in sufficient detail.

The surveys of the immediate ap-
proaches to Panama, although imper-
fect, are serviceable; and the same may
be said of the Central American and
Mexican coasts which connect the Re-
public of Panama with the completely
surveyed Pacific coast of the United
States. Of the coastal waters in the
northeastern Pacific much more is
known in relation to the waters of the
British dominions than with reference
to the Alaskan coasts. Indeed the ma-
rine hydrographic surveys of Alaska
are as yet very incomplete, especially in
the Aleutian Islands, where many coasts
remain barely explored. Russian Si-
beria and Korea have for the most part
only been hydrographically explored;
but nearly all of the coasts of the Em-
pire of Japan have been completely sur-
veyed and charted, and the coasts of
China, together with the China Sea,
where British surveying ships have
worked continuously for fifty years to
put in their right positions the multi-
tude of rocks and shoals which encumber this region, are now well known. Much, however, yet remains to be done on the eastern and southern confines of this sea. Only the most important harbors and sections of coast in the Philippines and the Dutch East Indies have been well charted. Parts of Tonquin and the southern, and especially the eastern, passages into the China Sea need much additional examination in detail. Australia and New Zealand are enveloped with good nautical charts, which are constantly being amended as new developments give rise to increased needs for more detailed surveys, and most of the important harbors and the thickly inhabited maritime sections have been quite completely done. The Coral Sea, or what is termed the outer passage between Australia and the Indian Ocean, is now much improved beyond its former state, owing to the necessity of providing more direct routes than those which were formerly followed, and most of its dangerous reefs are now set down in the charts. British India is better surveyed than many other parts of the best-known coasts of the world, and the shores of the Red Sea and the Mediterranean have been minutely surveyed excepting in a few parts where minor details are not now important.

Of the coast of Africa, aside from that portion which fronts on the Red Sea and the Mediterranean, the most vaguely charted portion is that of Somaliland, and the most completely charted parts are embraced in that well-surveyed section, including Madagascar, which extends southward from Zanzibar around the Cape of Good Hope to the regions of Table Bay. The whole of the west coast can now be laid down with closeness to its true position on the face of the globe, and while some parts of it have been merely explored by the nautical surveyor, many other parts are better known, and some of the harbors and off-lying islands have been surveyed with considerable approach to completeness.

The coasts of Europe, excepting the Spanish peninsula and those parts bordering on the Arctic Ocean, are completely surveyed, and an important center of activity in marine hydrography has for many years existed in Great Britain, resulting not only in elaborate surveys of the waters of Great Britain and Ireland, but in meeting the demand for reliable nautical charts in every part of the British Empire and in whatever other parts of the world British trade has been active or springing up.

Nearly a century has now elapsed since the close of the era of discoveries among the vast groups of islands and coral reefs with which the immense area of the Pacific Ocean is studded, and the chaotic state of geography at that time, in which it was sometimes impossible for discoverers to return to the islands discovered, has given place to a state of order at the present day. The ships of all the great maritime nations have contributed in a greater or less degree to this advance by fixing the correct geographical positions of individual islands, by surveying harbors and anchorages in the various groups, and by disproving the existence of many supposed rocks and dangers which were set down in the older charts from reports of former navigators, often doubtless based upon misleading appearances of the sea.

But important as is the surveying work that has already been accomplished in the Pacific, it is only the beginning of that which is to come. There is scarcely an island group in the whole of Oceania that is completely charted. The great work that remains to be done here ought to progress more rapidly in the future, since all these lands have at length been parceled out among leading nations of the world.
THE WONDERFUL CANALS OF CHINA

BY U. S. CONSUL GEORGE E. ANDERSON, HANGCHAU, CHINA

There are several features in the canal system of China, especially of the Imperial or Grand Canal, which can be studied with profit by the people of the United States. One of these is the use of the canal for the production of food in addition to its uses as a means of transportation. Allied to this is the use of the muck which gathers at the bottom of the waterway for fertilization. Another is the use of every particle of plant life growing in and around the canal for various purposes.

The Chinese secure a vast quantity of food of one sort or another from their canals. To appreciate the exact situation with respect to the waterways, it must be realized that the canals of China cover the plain country with a network of water. Leading from the Grand Canal in each direction are smaller canals, and from these lead still smaller canals, until there is hardly a single tract of 40 acres which is not reached by some sort of a ditch, generally capable of carrying good-sized boats. The first reason for this great network is the needs of rice cultivation. During practically all of the growing season for rice the fields are flooded. Wherever a natural waterway can be made to irrigate the rice fields it is used, but, of course, from these to the canals or larger rivers there must be waterways. Where natural streams cannot thus be adapted the Chinese lead water in canals or ditches to the edge of their fields and raise it to the fields of rice by the foot-power carriers which have been described so often by tourist writers. However the water is supplied to the rice, it is evident that there must be a waterway leading to the field and back to a principal stream, which is generally a branch canal. These waterways naturally take up a considerable portion of the land, and the Chinese make as profitable use of them as of the land itself.

The first use of the waterways is for fishing. The quantity of fish taken from the canals of China annually is immense. The Chinese have no artificial fish hatcheries, but the supply of fish is maintained at a high point by the fact that the flooded rice fields act as hatcheries and as hiding places for the young fish until they are large enough to look out for themselves. In the United States this fish propagation annex to the canals is probably neither possible nor needful in view of the work done by the state and national bureaus; but in China it is nothing less than providential.

Along the canals in China at any time may be found boatmen gathering muck from the bottom of the canal. This muck is taken in much the same manner that oysters are taken by hand on the Atlantic coast. In place of tongs are large, bag-like devices on crossed bamboo poles, which take in a large quantity of the ooze at once. This is emptied into the boat, and the process is repeated until the boatman has a load, when he will proceed to some neighboring farm and empty the muck, either directly on his fields—especially around the mulberry trees, which are raised for the silk-worms—or in a pool, where it is taken later to the fields. From this muck the Chinese farmer will generally secure enough shellfish to pay him for his work, and the fertilizer is clear gain. The fertilizer thus secured is valuable. It is rich in nitrogen and potash and has abundant humus elements. This dredging of the
The Wonderful Canals of China

Canals for fertilizers is the only way by which the Chinese have kept their canals in reasonably good condition for centuries. The fertilizer has paid for itself both ways. Recently there were complaints filed at Peking that the ashes from the steam launches plying on the canals were injuring the muck for fertilizing purposes, and the problem has been considered a serious one by the Chinese government.

In addition to securing fertilizers from the canals, and thus keeping the canals in condition, the farmers help keep them purified by gathering all floating weeds, grass, and other vegetable debris that they can find upon them. Boatmen will secure great loads of water plants and grass by skimming the surface of the canal. The reeds growing along the canals are used for weaving baskets of several grades and for fuel. In short, no plant life about the canal goes to waste.

Where there are so many canals there is more or less swamp ground. In China this is utilized for the raising of lotus roots, from which commercial arrowroot is largely obtained. There is no reason why much of the waste swamp land in the southern portion of the United States should not be used for a similar purpose, and the commercial returns from a venture of this sort in that part of the country ought to be satisfactory. Where the canals of China widen, by reason of natural waterways or for other reasons, the expanse of water not needed for actual navigation is made use of in the raising of water nuts of several varieties, especially what are known as water chestnuts. These nuts are raised in immense quantities. They are, strictly speaking, bulbs rather than nuts. They are rich in arrowroot and are prolific, an acre of shallow water producing far more than an acre of well cultivated soil planted in ordinary grain or similar crops. These nuts, also, could be produced to advantage in the United States where there is land inundated for the growing season to a depth which will give ordinary water plants a chance to thrive and which is not capable of being drained for the time being. The nuts or bulbs are toothsome when roasted, and are wholesome, but probably would be more valuable in the United States for the manufactured products which can be secured from them.

There are duck farms all along the canals in China. These are profitable. Chinese canals, as a rule, considering the population upon them and their varied uses, are cleaner than canals in the United States. There are few if any factories to contaminate them. The Chinese use of certain sewage for fertilization also prevents contamination to a great extent. The canal water is used for laundry, bath, and culinary purposes indiscriminately. A canal in the United States could never be what it is in China, but the Chinese have a number of clever devices and ideas in connection with their canals which can be adopted in the United States with profit.

The Grand Canal system in China has existed in almost its present shape since about the time Columbus discovered America. The Grand Canal itself, extending from Hangchau to Peking, is about a thousand miles long. Much of it is banked with stone, and all of it is in such condition that with the expenditure of a little money the system could be put upon a modern and effective basis. As it is, the canal handles practically all the internal trade of China, and this trade is far greater than its foreign trade. The coming of railroads will affect the canals somewhat, but not so much as may be imagined, for the railroads will very largely build up a trade of their own. A little money will make China's canal system in the future what it has been in the past, the greatest on earth.
GEOGRAPHY AND CULTURE*

It has been often remarked how much the various wars of the past ten years have educated the people in geography. Southeastern Europe, South Africa, the West Indies, the China coast, Japan, Korea, and Siberia have in their turn been "discovered" by millions of people who had previously entertained very lazy notions as to their existence on the face of the earth. Yet, rather singularly, there are more complaints today concerning the ignorance of geography among all classes, high and low, than ever before.

The universities, colleges, and schools are under more criticism than hitherto for their alleged failure to give to geography, broadly considered, its proper place in their courses of study. A year or two ago Mr. Bryce delivered an address before a geographical society in England in which he emphasized the importance of geography in any scheme of education or culture. Lord Salisbury, not long before he died, surprised his countrymen by saying that many of their misconceptions concerning international questions originated in the misleading scales of the maps of different countries and continents. It needs but a moment's reflection, indeed, to be convinced that while people in general have lately increased their stock of geographical knowledge, owing to these sensational wars and the closer jostling of the nations, we have only begun to realize how ignorant we are concerning the earth we live upon.

The great extent of the average person's real ignorance of geography is almost invariably shown whenever he begins to probe into some question of history or international politics. Very soon he discovers, rather to his surprise, that the whole matter may rest upon some simple fact of geography. A classic illustration is the discovery of America, which was the immediate result of the closing of the old Mediterranean trade routes to the Orient by the conquering Turks. Most people have a general idea that Columbus was seeking a new way to the Indies when he made his historic voyage, yet they never get far enough along to understand clearly why he was seeking that route. They do not know anything about the ancient routes through Asia Minor and around the Black Sea and what the Turks did to them. History cannot be intelligently understood, of course, without a clear knowledge of the geography of history. Huxley believed this so strongly that he never read a book of history or travels or international politics without an atlas by his side for constant reference. Yet most of the histories that are published even in our time are singularly deficient in good maps, and, strange to say, the great Cambridge series of modern history, planned by the late Lord Acton, contains not a single map in the first four volumes already printed.

Certain facts of geography account for very much of what goes on in our own time. The Boer war cannot be thoroughly understood unless one knows the peculiar relation that South Africa bears to India and Australia from the British point of view. The war between Russia and Japan is an insoluble mystery until one observes the position of Korea and the Sea of Japan with reference to the Russian outlet upon the Pacific. Why is Russia today such a despotism? Even that question should be answered in the light of the geography of the Russia of Ivan the Terrible and Peter the Great. What makes Ireland so poor? The climate, due to the island's geographical position with reference to the trade winds of the Atlantic, cannot be ignored in seeking an explanation of Ireland's position the past sixty years.

* From the Springfield Republican, December 18, 1904.
Why does Japan wish to expand in territory? We need only study the physical character of Japan to know. Why is Nevada such a backward state, and why is Arizona such an unpromising candidate for statehood? Here again geography can give an answer. Why did the negro race in central Africa remain for ages in an isolated, uncivilized, undeveloped condition? To answer that fully one must take account of the Sahara desert on the north and the great forest belt which follows in a wide, deep margin the west African coast.

Yet geography, with most people, has always been a "dry" study. Just why this is so might be discussed, perhaps, so as to yield interesting conclusions. Possibly, as taught for so long in the past, it was too unreal, too make-believe, too artificial to arouse interest, especially the interest of those with little imagination. The north was always up, the south down, the east at the right and the west at the left of the page. To be sure, the earth was round, with flattened poles, because the book said so; yet what one in a thousand, since the globular condition of the earth was accepted as a fact by the civilized world, has easily comprehended the significance of the great and small circles as to distances over continents and oceans? Then, too, the misconceptions one may draw from the ordinary maps are enormous, as Lord Salisbury intimated so strongly. We are so accustomed to large maps of our little corners of the earth that when we see maps of Asia, or Africa, made of the same size, our ideas as to the extent of those regions go hopelessly astray. When some one comes along and tells us how many Francés or Germanys or Englands could be embraced within the boundaries of Tibet, we are well-nigh upset. When President Roosevelt talks about "the mastery of the Pacific," "not one American in 500 can conceive the proposition in terms of geography, and geography has a tremendous lot to do with international politics.

It is said that geography is still largely a monopoly of the German schools; in England, they are poorly off, according to the complaints lately made in the London press. It is encouraging, however, to note a growing insistence everywhere upon fuller geographical knowledge and more nearly correct geographical ideas. No one can be a man or woman of real education and culture in the future to whom geography, in no narrow sense, is virtually a closed book.

TIDES IN THE BAY OF HUNDY

The accompanying plates of high and low tides in the Bay of Fundy are enlarged from photographs taken by Mr Roland Hayward, of Milton, Mass., in the summer of 1903. The views are of double value—first, in showing tides of unusual strength, and, again, in being taken from the same points for both high and low tides. The following general statements are from an article by Chalmers in the Report of the Geological Survey of Canada for 1894 (1895):

The mouth of the bay is 48 miles wide and from 70 to 110 fathoms deep. The bottom rises at a rate of 4 feet to a mile for 145 miles, to the head of the bay. On the coast near the mouth the spring tides vary from 12 to 18 feet. Within the bay the spring and neap tides are as follows: Digby Neck, 22, 18; St John, 27, 23; Petiociad River, 46, 36; Cumberland Basin, 44, 35; Noel River, in Cobequid Bay, 53, 31. The last named is, according to Chalmers, the greatest tidal range authentically
High Tide on the Petitcodiac River at Moncton, N. B.
High Tide on the Gaspareaux River, Wolfville, N. S.
reported for any part of the bay. At the head of the bay high tide is about 20 feet above mean sea-level. Low tide is as much below. The tidal bore is seen in Maccan River, entering Cumberland Basin; but it is stronger in Petitcodiac River, entering Shepody Bay. It is best seen at Moncton, where the first pair of views is taken.

Mr Hayward gives the following details:

The Petitcodiac River turns at Moncton from a northeast to a southeast course, then entering the northwestern branch of the bay. The mud flats are three-quarters of a mile wide at Moncton. The retiring tide leaves them covered with ripple-marks. The low-tide view was taken at 10.05 a.m., August 9, 1903, looking easterly. Here the foaming and roaring bore advances against a swift fresh-water stream, rising rapidly. Its height was about 3½ feet; its progress was 5 miles an hour. High water, as shown in the second view, is reached about three hours after the arrival of the bore.

The second pair of views was taken at Wolfville, on the eastern arm of the bay near the mouth of the Gaspereaux River, on September 7 and 8, 1903. The piles in the pier are stated to be 60 feet high. The great inconvenience attending so strong a range of tide may be imagined.

It may be well to recall a feature of the Bay of Fundy tides set forth by M. S. W. Jefferson a few years ago in his articles in this magazine, to the effect that the Fundy tides are practically synchronous from the mouth to the head of the bay, while the Chesapeake tides, for example, are progressively later and later from mouth to head; but the estuaries at the head of the Bay of Fundy have progressive tides, as in the Petitcodiac. The synchronous "swash" tides of the bay may be easily imitated in a model of an irregular shore on which a shallow sheet of water lies. Tide-like oscillations in the water may be made by an oscillating plunger; and when the proper period of oscillation is chosen, the tide in a funnel-shaped bay will have small range at the mouth and great range at the head, and the time of high or of low tide will be essentially synchronous all along the bay sides. At the same time a neighboring bay of different form may have progressive tides whose advancing waves may assume the form of a bore if the proper variation of breadth and depth of channel is given.

W. M. D.

FRENCH CONQUEST OF THE SAHARA *

By Charles Rabot

EDITORIAL SECRETARY OF "LA GEOGRAPHIE," MEMBER OF THE COUNCIL OF SOCIETE DE GEOGRAPHIE DE PARIS

T o traverse the Sahara from north to south, to join Algeria to the Sudan through the great desert of North Africa, and to subjugate the nomads who wander through that immense region has been one of the principal aims of France in recent years, and one which she has at length attained at the price of long and persevering effort. The hostility of the Touaregs was for a long time an obstacle. Established in the oases scattered over the Sahara, these Berber fanatics and brigands were accustomed to scan the whole desert, and

* An address to the Eighth International Geographic Congress, September, 1904.
as soon as they spied a caravan to fall upon it to rob and massacre. Often, too,
they were wont to attack the tribes of the extreme south of Algeria, who had
already submitted to French influences.

After the disaster to the Flatters
mission in 1881 and several other out-
rages committed by the Touaregs, the
French military authorities had post-
poned for a while all further desire to
penetrate into the Sahara and remained
simply on the defensive.

During this period of official inac-
tion, M. Fourcau accomplished a series
of very fruitful expeditions in the
desert regions south of Algeria. From
1883 to 1897 he traveled no less than
13,200 miles, of which 9,600 were in
regions entirely unknown.

Not only did M. Fourcau notably
augment our geographic knowledge by
this journey, but he inaugurated a
mode of traveling which has been very
fruitful for the exploration of the Sa-
hara. Instead of being accompanied
by a heavy caravan, like preceding mis-
sions, this traveler adopted the mode
of life and transport of the natives, taking
with him only a few faithful Arabs.
His little troop was mounted on "me-
haris," used by the Touaregs—rapid
camels, which are to the ordinary cam-
els of the caravan what race-horses are
to cart horses. Thanks to the mobility
of his caravan, M. Fourcau could per-
form long raids without being attacked
by the Touaregs. Meanwhile, from
1890 to 1892, a French officer, Colonel
Monteil, accomplished the crossing of
the Sahara from Tchad to Tripoli by
the caravan route.

The French, however, had never aban-
don the idea of a junction of Algeria
to the Sudan. In 1896 a member of
the Geographical Society, M. Renouf
des Orgières, encouraged this idea by
giving the society $50,000 to organize
an expedition to carry out this program,
and in 1899 M. Fourcau received per-
mission to traverse the Sahara and to
make his way through the desert to the
French possessions in Central Africa.
To ensure the safety of his caravan and
to compel a respect for the French flag
from the brigands of the Sahara, the
government gave M. Fourcau a numer-
ous military escort, commanded by
Major Lamy.

This Fourcau expedition started from
Ouargla (in South Algeria) at the end
of October, 1898, and a year later (No-
\vember 2, 1899) arrived at Zinder, at
the northeast extremity of French Su-
dan. In the April following, after
having gone round Lake Tchad by the
north and east, the expedition had ef-
fected a junction with the French troops
upon the Chari, the principal affluent
of the Tchad.

The march of the expedition was very
slow and painful in consequence of the
enormous caravan track behind it. Part
of its camels soon succumbed to the
fatigues of the journey, and it was im-
possible to purchase new beasts of bur-
den from the nomads. The Touaregs,
confident of their strength, threw them-
selves at various times against the little
 troop; but, having learned in these en-
counters that they could not be victori-
ous, they abandoned active hostilities
and limited themselves to creating a
complete dearth of supplies around the
explorers. It was only through the
energies of M. Fourcau and of the mili-
tary chiefs that the expedition was able
to get along at all.

The slowness of this journey has had
very favorable results from the scientific
point of view. It has permitted M. Fou-
cau to acquire a very complete knowl-
edge of the country and to collect a very
rich harvest of observations of interest
to all fields of geography. A great
work setting forth these scientific obser-
vations is in course of publication and
is being offered to all important geo-
graphic societies.

The Fourcau mission opens a new era
in the French penetration of the Sahara.
At the moment when this expedition was setting out the French government gave up the defensive attitude, and, abandoning the merely defensive policy observed since the Flatters mission in 1881, decided to extend further southward the zone of French influence, which then did not pass 3° latitude north. On the 28th of December, 1899, M. Flamand, a naturalist, was instructed to make a study of the region which it was proposed to annex, and was attacked at In-

Scenes on Lake Tchad

Mediterranean to the northern curve of the Niger at Timbuctoo.

This military advance has had interesting results from the point of view of geography. An excellent map on the scale of 1:250,000 has been made by Lieutenant Nieger of the whole region of Touat and Tidikelt, hitherto imperfectly known. Moreover, M. Flamand has published interesting notes on the morphology and geology of this part of the desert. To ensure protection of

Sala. Immediately the French troops advanced on their "meharis," commanded by Captains Germain and Pein, two brilliant Sahara officers. Some months later the French occupied the chain of oases of Gourara, Touat, and Tidikelt, more than 300 kilometers in length, which runs along the subterranean courses of rivers descending from the high plateaus of Morocco and Algeria. In this way the French had advanced nearly half the distance from the the oases thus acquired against the incursions of the Touaregs, the military authorities recognized the necessity of abandoning the old mistake of simply remaining on the defensive. In order to assure the tranquillity of the country, it was necessary at the first attack from the brigand tribes to pursue them vigorously through the desert, and not to give up until a sharp lesson had been inflicted.

This result could only be obtained by
a very mobile and acclimatized troop. It was decided therefore to undertake the creation of troops mounted on "meharis" and composed of natives under the command of French officers. This organization was inspired from that of the famous "dromedary companies" instituted by Bonaparte in Egypt, and by that of the "camel corps" recently adopted in the Sudan by the British army.

Since that time the French troops have been on an equality of speed and mobility with the Touaregs, while their superiority of arms ensures victory even against superior numbers.

These Saharan troops once organized, the officers commanding the extreme southern posts upon the Algerian frontier undertook long raids into the Sahara, traversing and surveying vast unknown regions and at the same time acting as a vigilant police. On March 26, 1901, the Touaregs having come to rob the people of Tidikelt, Lieutenant Cottenest started with 130 native troops and reached the mountain mass of the Hoggar and inflicted a severe lesson upon the brigands, returning to In-Sala after having traveled 1,000 miles in 62 days in a country entirely hostile. The same year, from the 16th of May to the 15th of June, Major Laperrine explored the Mounydir, a plateau surrounded by valleys from 200 to 300 meters deep and containing an abundance of water, wood, and excellent pasture.

Some time later, in 1902, Lieutenant Guillot-Lohan returned to the Hoggar plateau and pushed south to 22° latitude north. In 1903 Lieutenant Bessel effected a raid of 750 miles in the south, and some months later Major Laperrine, accompanied by Professor Gautier, directed a new reconnaissance in the Mounydir and the Ahnet. At the same time Captain Pein effected a raid round the Temassnine in the region situated farther east.

These different expeditions have completed and transformed the situation of the Sahara. The Touaregs, finding themselves chastised for the smallest act of rapine and always overtaken in their haunts, have now given their submission to Captain Metois, commanding at In-Sala. Only the tribe of Azguners, which wanders in the eastern Sahara, has as yet refused to accept French domination.

Accordingly a new and decisive operation was undertaken. At the commencement of February, 1904, Major Laperrine, quitting In-Sala at the head of a troop of "meharis" and taking his route south, succeeded in traversing the Sahara and meeting a second troop of "meharis" which had set out from Timbuctoo. In this way was effected the junction of Algeria with the Niger, previously accomplished by M. Foureau, but now by a more eastern route.

In this expedition Major Laperrine was accompanied by an astronomer, M. Villate. From a geographical point of view these raids have had very important results. The officers who have commanded them have brought back precise methods and numerous observations of interest. As a result of the reconnaissance in which he took part in 1903, Professor Gautier has made a geological map of Mounydir and Ahnet, in the very center of the Sahara.

The junction of the parties from In-Sala and Timbuctoo took place on April 18, at the well of Toniaoune by 20° 10' north latitude. The party from Algeria, under Commandant Laperrine, had come through Inzize and Timissao. After he succeeded in joining hands with the southern party, the commandant pushed a little farther south, as far as the well of Tin Zaouatem by 19° 57' north latitude, but soon resumed the journey northward to In-Sala, following a fresh itinerary. Scarcity of water and the heat (it was in May) made the
homeward journey very trying, part of the men having to travel as far as 320 kilometers with hardly any water. News received from this expedition points to the extension southward of the volcanic formations discovered by M. Gautier in Monydir.

Thanks to M. Fourreau and to the officers commanding the posts of the extreme south of Algeria, considerable progress has been accomplished by the new method of exploring the Sahara by the employment of "mehara" (singular of "mehari"). This camel can bear, besides his rider and his arms and accoutrements, 30 days' victuals and two skins of water. With this load he can march from 3 to 5 1/2 miles an hour and amble at a pace of 5 miles. In the raid executed in 1903 by Commandant Laperrine and Professor Gautier 69 miles were traversed in 29 hours.

One has no need for anxiety as to feeding the mehari; the desert flora suffices for its food, and in summer it can endure 5 days without drinking, while when plants are green it can go without water for 18 or 20 days.

By this method of penetration in the Sahara, M. Fourreau and these French officers have there accomplished progress as important as that effected by Nansen in his Arctic exploration. By adopting the means of locomotion and of existence of the Polar peoples, the Norwegian explorer gained a memorable victory. In the same way, by borrowing from the inhabitants of the Sahara their mode of life and locomotion, the French have triumphed over the obstacles which the nature of the soil and of the inhabitants had set against the exploration of the great desert of northern Africa.

OBSERVATIONS ON THE RUSSO-JAPANESE WAR, IN JAPAN AND MANCHURIA*

By Dr. Louis Livingstone Seaman

The Japanese soldier has been taught how to treat his intestines, and consequently his intestines are now treating him with equal consideration. His plain, rational diet is digested, metabolized and assimilated. It is not an irritating, indigestible, fermenting mess, acting as a local irritant and producing gastritis, duodenitis, enteritis, colitis, hepatitis, and the long list of inflammatory intestinal processes with which we were all so familiar in the hospital wards at Camp Alger, Chattanooga, Tampa, Cuba, Porto Rico, Montauk Point, &c., in 1898.

The great hospitals are there, interne, contagious, and infectious departments, their conspicuously empty beds voicing more eloquently than words the most important lesson of the war. A few cases of diseases of the respiratory system are found—colds, bronchitis, and an occasional pneumonia—contracted through exposure in fording rivers, exhausting marches, and bivouacking on wet ground, a few more of typhoid (I saw only three in Manchuria), occasionally one of dysentery, and a number of cases of beri beri, that former scourge of oriental armies.

But of all the many thousands gathered in these institutions there were but

*Abstract of an address to the National Geographic Society, December 9, 1904. Those desiring further information on this subject are referred to Dr. Seaman's instructive book recently published by D. Appleton & Co.
a few medical cases, and of these scarcely
a baker's dozen came under the heading
of 'Diseases of the digestive system.'
Therein lies one of the greatest secrets
of the Japanese success. Napoleon never
made a more truthful statement than
when he said: 'An army fights on its
belly.' The Japanese have that belly,
and they take good care to keep it in
fighting order, not by insulting it three
times a day by cramming it with materi-
al totally unsuited to the soldier's ne-
cessities, thereby exciting irritations and
disease, but by supplying it with a plain,
palatable, easily prepared and easily di-
gested ration that can be thoroughly
metabolized and converted into the
health and energy that make its owner
the ideal fighting machine of the world
today.

The organization of the medical de-
partment of the Japanese army and navy
is modeled after that of the Germans,
with many added improvements. Too
much praise cannot be bestowed upon
the medical department of the army and
navy for their splendid preparatory work
in this war. The Japanese are the first
to recognize the true value of an army
medical corps. The medical officer is
omnipresent. You will find him in
countless places where in an American
or British army he has no place. He is
as much at the front as in the rear. He
is with the first screen of scouts with his
microscope and chemicals; testing and
labeling wells so the army to follow shall
drink no contaminated water. When
the scouts reach a town he immediately
institutes a thorough examination of its
sanitary condition, and if contagion or
infection is found he quarantines and
places a guard around the dangerous
district. Notices are posted, so the ap-
proaching column is warned, and no
soldiers are billeted where danger exists.
Microscopic blood tests are made in all
fever cases and bacteriological experts,
fully equipped, form part of the staff of
every divisional headquarters.

The medical officer is also found in
camp, lecturing the men on sanitation
and the hundred and one details of per-
sonal hygiene—how to cook, to eat, and
when not to drink, to bathe, and even
to the direction of the paring and cleans-
ing of the finger nails to prevent danger
from bacteria. Up to August 1, 9,682
cases had been received at the reserve
hospital at Hiroshima, of whom 6,636
were wounded. Of the entire number
up to that time only 34 had died.

It is the rule of the Japanese surgeons
at the front to do little or no operating
except in cases of extreme emergency or
where hemorrhage threatens immediate
death. All cases are treated by the
application of the first aid dressing and
then sent to the rear as quickly as pos-
sible, thence by hospital boat or trans-
port to the base hospitals in Japan.

If the testimony of those conversant
with the facts can be accepted, supple-
mented from my own limited observa-
tions, the loss from preventable diseases
in the first six months of this terrible
conflict will be but a fraction of 1 per
cent. This, too, in a country notoriously
insanitary. Compare this with the
fearful losses of the British from
preventable diseases in South Africa,
or, worse, with our own losses in the
Spanish-American war—where, in a
campaign the actual hostilities of which
lasted six weeks, the mortality from
bullets and wounds was 268, while that
from disease reached the appalling num-
ber of 3,862, or about 14 to 1, or 70 per
cent—1 per cent against 70 per cent.

Naturally one asks, Were these re-
results anticipated? As an answer, the
statement of a distinguished Japanese
officer, when discussing with me the
subject of Russia's overwhelming num-
bers, is pertinent. 'Yes,' he said,
'we are prepared for that. Russia may
be able to place 2,000,000 men in the
field. We can furnish 500,000. You
know in every war four men die of dis-
ease for every one who falls from bul-

lets. That will be the position of Russia in this war. We propose to eliminate disease as a factor. Every man who dies in our army must fall on the field of battle. In this way we shall neutralize the superiority of Russian numbers and stand on a comparatively equal footing."

Japan is the first country in the world to recognize that the greatest enemy in war is not the army of the invader, but of a foe more treacherous and dangerous—preventable disease, found lurking in every camp.

If wars are inevitable and the slaughter of men must go on—and I believe wars are inevitable and that most of them are ultimately beneficial—then, for the love of God, let our men be killed legitimately, on the field, fighting for the stake at issue—not drop them by the wayside by preventable disease, as we did in the Spanish-American war—1,400 for every 100 that died in action. It is for the 1,400 poor devils who are sacrificed—never for the 100 who fall gallantly fighting—that I offer my prayer.

The state deprives the soldier of his liberty, prescribes his exercises, equipment, dress, diet, the locality in which he shall reside, and in the hour of danger expects him, if necessary, to lay down his life in its defense and honor. It should therefore give him the best sanitation and the best medical supervision that the science of the age—be it Japanese or Patagonian—can devise.

**HELPING THE FARMERS**

In the January number of this Magazine considerable mention was made of the work of the Department of Agriculture during 1904. The following paragraphs give information on certain lines of work which were not then described for lack of space.

**RECLAMATION OF ALKALI LANDS.**

The Secretary of Agriculture reports much progress made during 1904 on the alkali reclamation tracts established during the year previous, and indications point to the complete reclamation of the lands under experimentation at an early day. At the inception of the work on a 40-acre tract near Salt Lake City, a soil survey showed the first 4 feet of soil to contain more than 6,650 tons of soluble salts. In May, 1903, eight months after, there had been removed by drainage nearly 50 per cent of this immense total, and in the following October only 1,221 tons remained in the entire tract.

The progress of similar work on a 20-acre tract at Fresno, Cal., has been no less gratifying. The Secretary declares his full confidence in the final success of this work and a firm belief that it will lead to individual or concerted action on the part of those most interested, with the result of greatly benefiting both the agricultural and stock-raising interests.

**GROWTH OF CUBAN SEED TOBACCO.**

In the line of tobacco investigations which are carried on by the Bureau of Soils the most important work during the year was the experimental growing of Cuban seed tobacco on certain soils in Texas, Alabama, and South Carolina. Samples of tobaccos grown in 1903 were submitted to the trade, and the Texas leaf was found to have considerable merit both in regard to flavor and aroma. Some have pronounced it to be superior to any filler yet grown in this country. The Alabama filler leaf is considered fair. Final judgment of the success of this venture, however, must await further advices from dealers and manufacturers. Growing of the
Cuban type of filler has also been tried in Ohio. The most important work in Ohio, however, has been the further introduction of the bulk method of fermenting cigar tobaccos. Over 655,000 pounds were fermented in 1902, over 4,000,000 in 1903, while in 1904 the quantity so fermented exceeded 10,000,-
000 pounds. Considerable demand has been made the past year upon the Bu-
reaun to assist the growers of the heavy export types. Experiments have been undertaken to grow the tobacco with different fertilizers and under different methods of culture to see which will give the best financial results. It is yet too early to give the results of the present season's work.

SHADE-GROWN TOBACCO

In 1903 the Department of Agriculture had practically ceased its work in Connecticut in the production of shade-grown tobacco, but in 1904 it conducted an experiment at Tariffville, Conn., where a crop has been produced on a 4-acre plat. Tobacco of this type was exhibited at the Louisiana Purchase Exposition and received a grand prize as a leaf of the highest excellence for cigar wrappers. The Secretary presents a table which shows that 154 bales of Connecticut shade-grown tobacco have been sold for domestic use at an average price of $1.26 plus, the highest price obtained being $1.75 per pound for light wrappers. One hundred and forty-four bales were sold for export at an average of $0.34.

EXPERIMENTAL WORK IN COMBATING THE COTTON BOLL WEEVIL

The most important work of the Bureau of Entomology during the year has been its combat with the Mexican cotton boll weevil. Under the provisions of the special appropriation of $250,000, made available January, 1904, this work was greatly enlarged. Over a thousand acres, divided among thirteen experimental farms, were devoted to experi-

mental work, and it is believed that the cultural system these farms were designed to illustrate has so far proved to be the only practicable means of controlling the weevil. This is the out-
growth of several years of experimentation.

COLONIZATION OF THE GUATEMALAN ANT

The discovery of the Guatemalan ant and its colonization in Texas is a feature of distinct encouragement. The eminent danger of the spread of the weevil, however, to other States indicates the necessity of continued active and energetic work on the part of the general government.

MEANS OF COMBATING THE BOLL-
WORM

Field experiments have demonstrated that the cultural system of control recom-

mended for the boll weevil furnishes the very best means also against the bollworm. Spraying and dusting with arsenical potions and the value of truck crops have been made the subject of careful experiments, and the depart-

ment is now able to recommend measures which will greatly reduce damage from this pest.

BENEFICIAL INSECTS

The possibility of keeping injurious insects in check by the introduction of their natural insect enemies is a popular subject with fruit growers and farmers, and notable success has been achieved in this direction.

STUDY OF INSECTS DAMAGING FORESTS

The general information gained from the study of insects damaging forests, carried on both in the field and in the laboratory, has greatly advanced the knowledge of forest insects and the means of controlling them. An expert has been placed in charge of investiga-

tions of insecticides, and fumigation
experiments with fruit stock and buildings and granaries are now under way, as well as cooperative work between the Bureaus of Entomology and Chemistry on the composition of insecticides.

BIOLOGICAL SURVEY

The work of the Biological Survey has been continued along three principal lines: First, investigations relating to the geographical distribution of animals and plants, including biological surveys and the determination of the life and crop belts; second, investigations of the economic relations of birds to agriculture; third, supervision of matters relating to game preservation and protection and the importation of foreign birds and animals. In carrying out this threefold mission the Biological Survey is divided into three sections—that of geographical distribution, that of economic ornithology, and finally one of game protection and introduction.

IMPORTATION OF BIRDS AND MAMMALS

Constant vigilance is necessary to prevent the introduction into the United States of birds or animals likely to become pests. The permits issued during the year numbered 318, and included 1,470 mammals and 250,000 birds.

ENFORCEMENT OF GAME LAWS

Six convictions for illegal traffic in game were secured during the year under the Lacey act, making 42 convictions secured in cases passing through this department. In Alaska the game law has accomplished two main objects—the shipment of deer heads has been stopped, and the export of heads of big game as trophies has been curtailed.

PUBLIC ROAD INQUIRIES

Object-lesson roads have been constructed with the cooperation of the office of public road inquiries in Arkansas, Ohio, Tennessee, Virginia, and West Virginia. These were mostly first-class macadam roads. It has also cooperated at several points in the South in constructing experimental roads of a mixture of sand and clay. In the absence of stone and gravel, this mixture may be used to great advantage. Much has been accomplished during the year in the development of good roads by the state-aid plan. The main features of this plan as now adopted in several states are a state highway commission, appropriations from the state treasury to pay a portion of the expense, the balance being divided between the counties, towns, and the owners of property along the improved roads. Since 1890 eleven states in all have provided, in a greater or less degree, the state aid.

Much time has been spent in studying the physical properties of clays in an endeavor to devise methods by which they can be utilized in road making. Of 228 samples of road materials reported during the past year, 35 were clays. Clinkered clay has been successfully used for some time past as a railroad ballast. Experiments were made with samples of the so-called gumbo clay from the Yazoo district of Mississippi, and following these experiments the Office of Public Road Inquiries built an experimental road in Yazoo City, which has been reported successful. The Division of Tests has not confined itself to investigations of clays in their use as road material, but to their useful properties for any purpose, with a view to developing the use of native clays, of which the production already exceeds $2,000,000 annually, while of foreign clays over $1,000,000 worth are imported.

OILS AND ASPHALTUM FOR ROADS

The suggestion of the Division of Tests to road builders throughout the country to make experiments with mixtures of crude oils and crude asphaltum in road building has resulted in some cases very satisfactorily.
A SCHOOL FOR ROAD BUILDING RECOMMENDED

In connection with the subject of road materials the Secretary of Agriculture urges the desirability of a school for road building in connection with the department, the students to consist of men who have already received degrees from reputable engineering schools.

EXPERIMENTAL WORK IN ALASKA

Many interesting experiments have been carried on in Alaska. Distribution was made, moreover, of vegetable and flower seeds to some 1,500 persons, many of whom report success, and confirm the possibility of raising hardy vegetables in nearly all parts of the territory south of the Arctic Circle. In general, the experimental work in Alaska has shown that live stock could be successfully maintained at many points. Sheep raising has not proved successful, and the Secretary expresses the opinion that Alaskan grass lands as a whole can be most profitably used at present through dairying. The Secretary says it is doubtful if equally good opportunities for dairymen can be found in the United States today.

PUBLICATION WORK

The publication work of the department is a faithful reflex of its activity and growth. The number of publications issued during the past year aggregated 972, of which 379, comprising 23,000 pages of matter, were new. The number of copies of all publications printed during the year amounted to nearly 12,500,000. Of farmers' bulletins, of which 6,500,000 copies were issued during the year, nearly 5,000,000 were distributed upon the orders of members of Congress. Educational institutions are becoming more frequent applicants for publications, mainly for class work, and the Secretary suggests a plan by which, with the approval of Congress, unused congressional quotas of the department's publications might be made available.

A Flock of Goats on the Ranges of Arizona
As seen from the southern section of St. Pierre (looking north-northeast), and across an interval of about five miles.  
Height of obelisk, about 80 feet.  
Total height of the mountain, including obelisk, some what over 5,000 feet.
GEOGRAPHIC NOTES

NATIONAL GEOGRAPHIC SOCIETY

The annual meeting of the National Geographic Society was held at Washington, January 13. Eight members of the Board of Managers were elected to serve for the three years, 1905-1907, as follows:

Prof. T. C. Chamberlin, of the University of Chicago, was elected to fill the vacancy in the Board caused by the resignation of Prof. Wm. M. Davis, of Harvard University.

The report of the Secretary, Hon. O. P. Austin, showed that the present membership of the Society is 3,400, of whom 1,125 are residents of Washington and 2,275 distributed throughout the United States, Alaska, Philippines, Europe, Asia, and Africa. The net gain in membership for 1904 was 789. During 1904 the Society held 12 scientific meetings, 16 special meetings, and 4 field meetings.

At a meeting of the Board of Managers January 27 Dr. Willis L. Moore, Chief of the U. S. Weather Bureau, was elected President of the Society. Dr. Moore has been actively identified with the Society for many years, serving on the Board of Managers since 1899. At the same meeting Mr. Henry Gannett, Geographer of the U. S. Geological Survey, was elected Vice-President.

Mr. Gannett was one of the incorporators of the Society, in 1888, and with the exception of the year 1903, which he passed in the Philippines, he has served continuously on the Board since the Society was founded.

CHART OF THE WORLD

THROUGH the courtesy of the Hydrographic Office of the Navy Department, and more particularly of Captain H. M. Hodges, hydrographer, and Mr. George W. Littlehaies, the NATIONAL GEOGRAPHIC MAGAZINE publishes as a supplement to this number a chart of the world on Mercator’s projection, showing the submarine cable lines and their connections and ocean routes. Cable and telegraph lines are printed in red and ocean routes in blue. The latest cable lines are shown—as, for instance, the Alaskan cables of the U. S. Signal Corps and the wireless connection across Norton Sound. The tables of distances printed on the bottom of the chart will doubtless be found very convenient by many. One table tells at a glance the comparative distances of New York and Shanghai, or Yokohama by the Panama, Suez, and Cape of Good Hope routes. Another table gives the distances of our Gulf ports from the Atlantic end of the Panama Canal (Colon), and also from each other. The chart can be easily detached from the Magazine and hung on the wall for more convenient use.

NOTES ON THE PHILIPPINES

One of the most striking facts in the report for 1904 of Col. Clarence R. Edwards, U. S. Army, Chief of the Bureau of Insular Affairs, is the statement that only $3,500,000, or less than 5 per cent, of the $60,000,000 worth of goods entering and leaving the Philippine Islands in 1904 were carried in American bottoms. What a lamentable instance of the insignificance of our merchant marine, which, like our iron, coal, and agricultural industries, ought to be the greatest in the world.

During the year nearly 13,000 Americans went to the Philippines with the intention of making their permanent home there. Most of them did not specify the nature of their occupation, but among those who did were 333 teachers, 117 engineers, 50 physicians, 47 clergymen, 33 lawyers, 406 clerks and accountants, 186
merchant dealers and grocers, 58 mariners, and 18 miners. Many of these had received civil-service appointments from the United States. The administrative acts of the Bureau during 1904 were previously described by Colonel Edwards in the National Geographic Magazine of June and July.

"The question of labor in the Philippines has ceased to be a critical one, says the Collector of Customs for the Philippine Islands in his report for 1904. Despite the gloomy predictions of many thoroughly sincere investigators and writers on the subject, the Filipino laborer has conclusively demonstrated that he is a practicable and dependable element in the industrial development of the Islands. In the past two years several immense enterprises have been successfully carried on solely with the aid of Filipino laborers. All goods arriving at or leaving the port of Manila are handled by natives. During the past year the operation of the customs 'Arrastre plant' has been entirely in the hands of native labor, including the steam tramway and four large steam cranes.

"The Filipinos make good clerks, copyists, typewriters, sub-inspectors, and, in some instances, excellent fiduciary officers. In the handling of cash, in subordinate positions, they have shown a high degree of accuracy and integrity. As marine officers and engineers, especially in the latter position, they have exhibited a skill, fidelity, and courage which entitle them to unstinted admiration."

TRANSPORTATION IN ENGLAND

At the present time, when there is so much comment on transportation rates in the United States, the following statements from an American consul in England of conditions in that country may surprise some of us:

"The carriage for a ton of apples from Folkestone, on the south coast of England, to London, is $3.86, while goods of the same class are carried from California to London for $3.81. It costs $9.73 to send a ton of British meat from Liverpool to London, while it costs only $6.00 to send a ton of foreign meat to the same market. The Irish farmer who wants to get his produce to London has to pay $22.88 carriage per ton on his eggs from Galway, while the Danish farmer can send eggs into the London market for $3.85, the Russian for $5.10, and the farmer in Normandy for $4.05. The man down in Kent, who is almost at the London market, has to pay $6.10 per ton to the railway companies for carrying the produce of his orchard to London, while the same class of freight is brought from Holland for half the money."

TO OBSERVE SOLAR ECLIPSE

R EAR Admiral C. M. Chester, superintendent of the Naval Observatory, has submitted a recommendation for provision for a naval expedition in 1905 to observe a total solar eclipse. He proposes to select an observation station among the high hills bordering on the Mediterranean, to work with some ship as a base near Valencia, and another station in the uplands, with headquarters on board a vessel on the northeast coast of Spain.

Ranges of Arizona.—David Griffiths is the author of a recent bulletin published by the Department of Agriculture, describing the ranges of Arizona and the measures necessary for their protection. The ranges can carry without injury one horse or cow to 50 or 100 acres. The range-owners have lately begun goat-raising with considerable profit. The picture on page 85 shows a flock of goats on one of these ranges. Excessive stocking has been destroying the value of the ranges.

This exceedingly handsome volume is a supplement to "Mont Pelee and the Tragedy of Martinique," published by Professor Heilprin in 1902. In it the author discusses the peculiar spine or obelisk which was thrust up the throat of Mont Pelee in 1903, rising to a height at times of nearly 850 feet, and which has since entirely disappeared. The series of views of this obelisk taken by Mr Heilprin and published in the volume are remarkably fine. One of them is reprinted in this Magazine on page 86. Mr Heilprin also publishes several pictures of glass water bottles and wine glasses which show marked deformations of substance without breakage. "There are no indications of glass flow, and the only apparent change that the glass has undergone is an acquired wrinkles. The substance had evidently yielded to pressure impacts at a time when it was subjected to and softened by great heat. This condition sufficiently explains the similar condition of objects found at Pompeii, and does away with the necessity of assuming that the deformation was the result of a slow and steadily progressing molecular change whose workings extended through centuries (!)" Mr Heilprin believes that Pompeii was destroyed in very much the same manner as St Pierre and not, as has been generally assumed, by "simple incineration."

This is a real book by a naturalist and explorer of the old type, and from preface to conclusion is full of vivid and sharply drawn pictures. To any one who loves the solitude of the forest or who has felt the charm of the tropical jungle the book must appeal in the same way that Belt's "Naturalist in Nicaragua" or Bates' "Travels on the Amazon" have for many years fired the imagination of the youth of America and England; but to the writer the book has an additional reality and an indescribable fascination, for it describes the travels and ghastly hardships of a friend.

In 1899, while traveling with Mr Barbour Lathrop, of Chicago, I met the author in the Port of Spain, and I shall never forget the enthusiasm with which Mr Lathrop announced the discovery of this unusual naturalist. We traveled with him later from La Guayra to Panama, and the last time I saw him he was running home a charge in his muzzle-loader after a shot at some gorgeous Colombian song bird.

To the public at large South America is a puzzle. It reads of the great industrial and railway development of the Argentine, of the immense waterway of the Amazon, of the beauties of Rio de Janeiro, and of the ancient Inca civilization of Peru, but there is a silence in the popular literature regarding the immense center of the continent, to which these civilizations of the Argentine, Chili, Peru, and Venezuela form the merest fringe. Eugene Andre has pushed his way along the watercourses and through the jungles of this greatest of all unexplored tropical regions of the world, and this book which he has written gives a picture of the extreme discomforts, the real hardships, and the frightful exposure to disease and starvation which attends the work of exploration in the uninhabited tropical forest. To a boy familiar with the popular literature on tropical forests nothing could be more delightful than to make one's way, with hunting outfit and canoes, from Rio to Panama, living on the game and the fruits of the forest. Andre's account of
his explorations dispels any illusions of the luxury of travel in tropical forests and makes the hardships undergone by Wallace in the Aru Islands or by Schweinfurt among the Naim Naim people of Central Africa seem insignificant.

The book describes two expeditions, in 1897–1898 and 1900–1901, from Trinidad up the Orinoco toward the headwaters of the Caura, with side trips up the Nichare and cross-country expeditions cut through the forest to Mounts Turagua and Amécha, two of those remarkable mesa-like mountains which are characteristic of southern Venezuela. It is a narrative of daily experiences and observations and sparkles with that humor which is a necessary quality of a good explorer. The observations on animals and plants are unusually vivid and interesting and written with care, yet nowhere prosaic. His ability to take the reader into his confidence and to picture the trials of a naturalist in the tropics may be illustrated by the following:

"If the hornets pay attention to the person of the collector the ants devote themselves to looking after his collections, so that what with having to dodge a being with wings and a sting who means business when he has made his mind up, and trying to devise ways for keeping his property out of the way of an insect that can find a grain of sugar in a stack of hay, the amateur naturalist acquires his first real knowledge of the powers of those so-called lower forms of life."

It were beyond the province of a review to enter in any detail, but as I run over the pages of my friend’s book, to collect the materials for which has twice almost cost him his life, certain of his observations seem most worthy of attention. His observations on the healthfulness of Ciudad-Bolivar, situated on the edge of a swamp into which all the village refuse is dumped, those regarding the Indians’ confirmative belief in the mosquito as a carrier of the malarial fevers, and the presence of malignant ulcers in certain localities, reminding one of the Bagdad boil, have a bearing upon recent medical researches. His descriptions of the parasol ants, Oecophora, and the manufacture of their fungus gardens remind one of Belt’s historic descriptions. His remarks regarding the power of insects to locate at a distance the objects of their desires and make straight for them is as interesting as anything Maeterlinck has written about the bee.

The ichthyologist will find valuable observations in the book on the strange cannibal fishes of the Caura, and laugh at the antics of the alligator disturbed by the explosion of a dynamite cartridge in its particular pool. The rubber experts will read with interest of the forests of a new rubber tree discovered on the Nichare, a branch of the Caura, and of the Indian method of tapping the rubber tree in this region. Those who know the cinnamon perfume of the Tonka bean will be interested to learn that these forests furnish the world with the sweet-smelling bean, and that their collection is a lucrative business. The geologist will find enough of interest in André’s descriptions of the formations of the rocky canyons and river bottoms of the Caura and mesa-like mountains to hold his attention. The ornithologist will find described and pictured in cromolithographs at least two rare gorgeous tropical birds and mention of the habits of many other new species, while those ladies who wear egrets without a thought of where they come from will get from these pages the scolding of an ornithologist for assisting in the extinction of the beautiful tropical birds from which at their death the graceful egrets are plucked. The exciting part of the book to the average reader, however, begins in chapter xviii with a description of the wrecking in the rapids of the boat containing all the provisions, clothes, tools, and note books of the party. From this point on, the center
of interest changes and fastens upon the hardships of this little band of almost naked men in their weary marches through the tropical jungle. Without shelter from the tropical rains, with no food but occasional game and wild fruits, with fever-racked and emaciated bodies, and with discontent and mutiny among them, they dragged their way, aided by the remaining small canoe, 200 miles through the forest toward the outskirts of civilization. Twenty-six days can seem a lifetime and proved to all but six of the party of fourteen their closing days.

But it would be a mistake if I were to give the idea that the book is a gloomy account of hardships. On the contrary, it is full of a sparkle of incident and vividness of description that makes it stand out from the commonplace of ordinary works of travel and worthy of a place on the same shelf of honor of a naturalist’s library with Darwin’s and Humboldt’s travels, Wallace’s “Malay Archipelago,” and Belt’s “Naturalist in Nicaragua.”

DAVID FAIRCHILD, Agricultural Explorer.

THE PHILIPPINE ISLANDS, 1493-1898

It is strange that Messrs Arthur H. Clark Co., of Cleveland, Ohio, have not received better support for their magnificent series of volumes on the Philippine Islands. The history of the islands during the first three centuries after their discovery is buried in letters and manuscripts which were inaccessible until the Clark Co. began their publication under the editorship of Miss Blair and Mr Robertson. As to understand the Filipinos we must understand their complex past, the publication is patriotic as well as enterpriseing in plan. The publishers have issued the following statement:

“‘The support accorded our publication, ‘The Philippine Islands, 1493-1898,’ has been so inadequate that we are facing a serious financial loss upon it. We have issued the work faithfully from month to month, and expect to complete it and fulfill our obligation to those who have supported it, even at a loss to ourselves. Thus far less than 100 sets have been placed in this country, although a larger number have been placed in the important libraries of Europe, India, Australia, the Far East, and the Philippines. Of the sets in this country nearly all are in public institutions; the remainder are in large private collections, which are not likely to come into the market for many years, if ever.

“With much regret we are now compelled to limit the edition to the number of sets actually ordered. Beginning with volume 22, to be published February 1, 1905, only enough of each volume will be printed to fill orders received before that date. Of the volumes already issued the excess above the subscribed number will then be destroyed, and the work will never be reprinted.

“The series is the only work making these sources available in any language, and its usefulness and importance to public men, students, and in large private libraries must increase from year to year, particularly when the current volumes cover more recent years and when the index volume makes the sources more easily available.

“Our interest in the islands must grow greater year by year because of the complex oriental problem, the conflicting claims of other nations in the Far East, the Chinese problem and race question, both in the South and Far East, the educational and religious situation, the failure of Philippine tariff systems of the last four centuries, the comparison of Spanish, British, and American colonial policies, etc.

“This set furnishes the final sources indispensable for a proper understanding of these problems. Few subjects are discussed so widely, yet so ignorantly, as matters relating to the Philippines.

“Only seven sets exist outside of public institutions, and all free sets for review must be discontinued.”

BOOKS RECEIVED

Select List of Books Relating to the Far East. Compiled under the direction of Appleton Prentiss Clark Griffin.
The address on the Philippines previously announced for February 3 has been postponed until after the adjournment of Congress, as it is believed that official demands will then permit the Secretary of War to address the Society on this subject.

POPULAR MEETINGS

National Rifles’ Armory, 920 G street, 8 p. m.

February 3.—“The Evolution of Russian Government.” By Dr Edwin A. Grosvenor, Professor of International Law and Modern Government in Amherst College.

February 17.—“Manchuria and Korea.” By Col. W. S. Schuyler, U. S. A. Illustrated.

March 10.—“The Panama Canal.” Rear Admiral Colby M. Chester, U. S. N., Superintendent of the U. S. Naval Observatory. Illustrated.

March 24.—“The Commercial Prize of the Orient and its Relation to the Commerce of the United States.” By Hon. O. P. Austin, Chief of the Bureau of Statistics. Illustrated.

March 31.—“From Lexington to Yorktown.” By Mr W. W. Ellsworth, of the Century Company. Illustrated.

April 14.—“Fighting the Boll Weevil.” By Dr L. O. Howard, Chief of the Bureau of Entomology. Illustrated.

April 28.—“Niagara Falls.” By Dr G. K. Gilbert, Vice-President National Geographic Society. Illustrated.

SCIENTIFIC MEETINGS

Hubbard Memorial Hall, 8 p. m.

February 10.—General subject, “Progress in Animal Husbandry.” There will be papers by Mr George M. Rommel, Mr G. Fayette Thompson, and others of the Department of Agriculture, on the work and plans of the Department for producing distinctive American breeds of Horses, on the Angora Goat, the Fat Tailed Sheep, the Barbadoes Woolless Sheep, on the introduction of the Bos indicus, etc.

February 24.—General subject, “The Botanical Investigations of the Department of Agriculture.” By Mr F. V. Coville, Botanist, and members of his staff.

March 3.—General subject, “Progress in Plant Physiology.” Papers by Dr George T. Moore and others on “Inoculating the Ground,” “Protecting Municipal Water Supply Systems,” etc.

March 17.—General subject, “Japan.”

April 7.—General subject, “Forestry.” Papers by Mr Gifford Pinchot, Mr Overton Price, and others, of the U. S. Bureau of Forestry, and a paper on Japanese Bamboos, by Mr David G. Fairchild.

THE TOWER OF PELEE
A SEQUEL TO
MONT PELEE AND THE TRAGEDY OF MARTINIQUE

Being an account of one of the most remarkable structures of the earth's surface, with further observations on volcanic phenomena.

By Prof. ANGELO HEILPRIN

A work unique in its field—sumptuously illustrated with 24 folio plates.

Small folio, $3.00 net; postage extra.

MONT PELEE AND THE TRAGEDY OF MARTINIQUE

"The most thorough account of the Antillean eruption of last year that has yet appeared. The book is indeed one of the best descriptions that we possess of an active episode of a long life of a volcano."—The Nation, New York.

8 vo, fully illustrated, $3.00

SHIRTS TO ORDER

We take it that you are particular in dress—that you like your shirts made to special measure with extra careful making and "just right" fit.

Such men should know of this store's facilities for turning out perfect-fitting shirts—should know that we employ the most skilled artists, and that we show at all times a most complete line of white and fancy shirtings and guarantee a perfect fit, assuming the entire loss if shirts are not satisfactory.

White Shirts, $1.50 to $3.00, the latter being made of English longcloth.

Madras Shirts of fabrics from the looms of the leading Scotch weavers, $3.50 each—cuffs attached or detached.
